

MUFG Share Sale Management Solution Vision

24 August 2026

Storyboard

Act 2 – Intelligent email processing

Personas

Investor (external), Intake Operations (internal)

Removes the bottleneck of manual email triage and data entry currently handled in legacy Lotus Notes ETS.

Act description

Investors submitting traditional PDF forms by email get rapid, automated intake and validation, eliminating manual mailroom sorting.

Steps in the act

1. An email with a PDF attachment arrives. Pega GenAI scans the document, extracts key values such as SRN and quantity, and classifies the intent as a share sale.
2. Pega instantiates the Share Sale Request case and cross-references the extracted data against Oscar and GreenID.
3. If the request is complete the case proceeds automatically; if not, Pega drafts and sends a contextual email back to the investor detailing exactly what is missing.

Key cases and steps

Share Sale Request (parent) → Intake & Extract Data → Validate Completeness → Send Automated Missing Info Request (Awaiting Information stage).

Key highlights of act

- Agentic Email
- Unstructured data extraction from PDFs
- Automatic case instantiation, no manual keying
- Contextual auto-response for missing information
- Reuse of logic – same 'path' serves scanned paper mail

Storyboard

Act 3 – Compliance and high-risk review

Personas

Compliance Officer (internal)

Removes compliance risk – no high-risk trade can execute in Oscar without a recorded human sign-off.

Act description

Strict, automated enforcement of AML/KYC obligations for high-risk transactions such as PEPs, sanctions hits and high-value limits, ensuring regulatory safety.

Steps in the act

1. The Pega rules engine identifies a high-risk trigger, such as an international disbursement or a sanctions list hit during GreenID screening. (Rule TBC from James)
2. Pega immediately places the case in a Compliance Hold alternate stage, freezing all communications and execution steps.
3. The case is escalated to the compliance team's specialised dashboard.
4. Request for more information (Detail TBC from Mahesh)
5. The Compliance Officer reviews the matched criteria, records the investigation findings and approves or rejects the request.
6. Pega logs an immutable audit trail and either releases the trade or triggers the rejection protocol.

Key cases and steps

Investor Verification (child) → Risk Assessment Rule Triggered → Compliance Hold stage → EDD Review → Resolve Hold.

Key highlights of act

- Pega for Financial Services – AML/KYC frameworks
- Balance of traditional business rules with AI for maximum effect
- 'Humans in the loop' control point before execution
- Communications frozen while on hold
- Immutable audit trail of the decision

Discovery notes

Follow-ups for the Solutions Consulting team post-Blueprint

- **API connectivity and security mapping** – determine the exact technical routing (AWS PrivateLink, Transit Gateway or VPN) and the security handshake configuration (OAuth 2.0, mTLS or API keys) required to securely connect Pega Cloud to the existing Oscar and GreenID APIs.
- **Data schema alignment** – perform a gap analysis between the existing Oscar and GreenID API payloads and the Pega Financial Services data model to map the fields needed for automated execution.
- **Paper scanning protocol** – define the operational routing and hardware setup required to scan physical paper requests and send them to the mailbox monitored by the Pega Agentic Email Agent.
- **Blueprint success criteria** – establish the quantitative and qualitative KPIs that will define the success of the Blueprint / pilot phase and trigger full-scale production.
